Builder and technical product manager who ships production software daily with AI coding agents. I turn vague workflow problems into scoped, instrumented systems that non-engineers run safely.

SKILLS

Languages & Backend: Python, TypeScript, JavaScript (Node.js), Django, PostgreSQL, REST API design, React, SQL/KQL, Bash, HTML/CSS, YAML

AI & Agentic Engineering: daily production development with AI coding agents (Claude Code plus an agent-skills standard interoperable with 17+ agents), Claude and OpenAI APIs, Azure OpenAI (GPT-4o, o3-mini)

Infrastructure & Tooling: GitHub Actions CI/CD, Docker, Linux VPS administration (systemd services, heartbeat monitoring), Azure, async job pipelines, Telegram Bot API, Twilio, Playwright

PROFESSIONAL EXPERIENCE

Product Manager

Microsoft

Feb 2023 to Present

Redmond, WA

Internal Tooling & Automation

- Conceived and built the team's first internal agent marketplace, letting engineers discover, install, and extend AI-assisted workflows across repositories; it grew into an org-level platform with ~400 active users.
- Architected the platform on an open, executable agent-skills standard interoperable with 17+ AI coding agents including Claude Code, built the build/test/release pipeline (GitHub Actions CI/CD) that gates every contribution before it deploys, and cut new-engineer environment setup from hours to ~30 seconds.
- Designed a multi-agent observability assistant so a ~300-person org could query performance and reliability data in natural language (~200 queries/week), with every answer carrying a confidence level, source attribution, and a freshness timestamp, replacing data pulls that previously required an engineer.

AI Evaluation & Production Launches

- Made image-description quality measurable for a \$2.6M/year service processing ~1.7B images monthly by building an LLM-as-judge pipeline (Python, Azure OpenAI o3-mini) on an existing five-dimension evaluation rubric I adopted and refined for a novel image-understanding domain, lifting quality scores from 30% to 80% and validating them against a 40-participant user study.
- Designed a governance bridge that structurally blocks AI agents from querying production data directly and routes them through authorized tools instead, making safe-by-default access a property of the platform rather than a policy people have to remember.

Experimentation & Platform Health

- Drove A/B experiments across a product serving millions, balancing feature velocity with rollout safety: a content-removal test lifted recent-file engagement 47% and template clicks 17% before a staged rollout to 100% of users, and a header-search redesign reached 46% click-through at 87% session success.

Founder & Developer

Self-Employed

Jan 2022 to Feb 2023

Remote

- Centralized communications and automated lead response so agents cut dropped follow-ups, sped first-contact time, and kept partner and deal-closing activity visible in one system, owning the full loop from requirements through production support.

PROJECTS

- **Personal agent platform:** Built and operate a 24/7 multi-agent assistant on a Linux VPS: PostgreSQL as the single source of truth, systemd-managed services with heartbeat monitoring, a Telegram bot command surface, an MCP server exposing ~40 tools, and async pipelines that run research and job-search workflows end to end; built and evolved daily with Claude Code.
- **Video automation CLI:** Wrote a TypeScript CLI (Node.js, ffmpeg, Whisper transcription) that takes daily short-form footage from raw clips to captioned, publish-ready cuts through typed, tested commands.
- **WhisperKey:** Shipped a privacy-focused macOS dictation app in Swift running OpenAI Whisper fully on device with zero cloud dependency, published as open source (GitHub.com/BSPLAZA/WhisperKey).

EDUCATION

Rutgers School of Engineering, Bachelor of Science: Computer Engineering, Minor in Computer Science

New Brunswick, NJ
